

Control Filter

Protects your High Vacuum unit

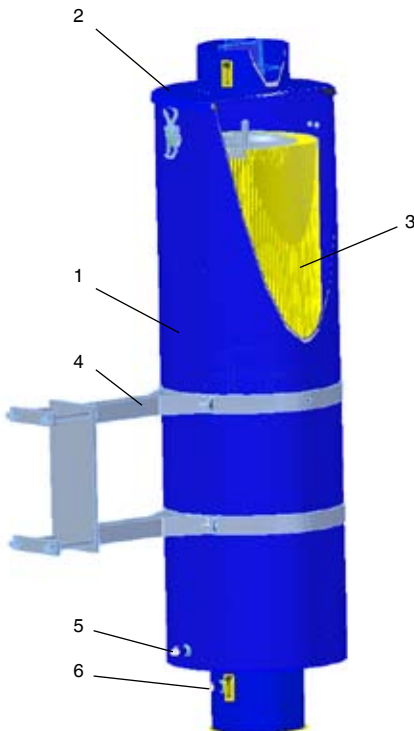

The control filter is an extra filter located between the dust collector and the vacuum unit (normally an RBU vacuum unit). The purpose of this control filter is to protect the vacuum unit from coarse and medium sized particles in case of a dust collector breakdown. Fitted with two nipples for connecting an optional control unit/pressure drop meter. The standard control filter is not a HEPA-type filter and it does not collect fine dust particles. Another type of filter and filter holder is available if high efficiency separation of fine hazardous dust is required.

- *Increases safety*
- *Protects vacuum unit*
