

Modular Hood

Configurable local containment hood for fume extraction in weld cells

The Nederman Modular Hood is designed to manage welding fumes in both manual and automated welding. It captures fumes at the source for safe extraction to the dust collection system, preventing their spread and enhancing worker safety while reducing maintenance costs. This approach is more efficient and cost-effective than traditional methods, as it reduces the required total air volume.

- Effective capture with baffled exhaust design for optimal airflow and spark deterrence.
- Configurable modular construction with 5' (1.5 m) length and width increments suits various welding areas.
- Low profile design fits tightly, minimizing additional workspace footprint
- Ergonomic with a clear Transparent Polygal® roof, improving visibility without added lighting.
- Flexible installation options, adjustable leg height, outlet choice, and duct connection size.
